

<Marine Organism Rearing Log>

9 AM, August 17, 2022

Weather: Cloudy

Water temperature: 18.1°C

The growth of bacteria is slow, they decompose ammonia in excrement of marine organism. If this goes on, it might impose a negative effect on marine lives, therefore, we replaced the filtering media at the top of stream with the other media with favorable bacteria clinging to it which used until July. The concentration is slightly decreasing. Follow-up is required.

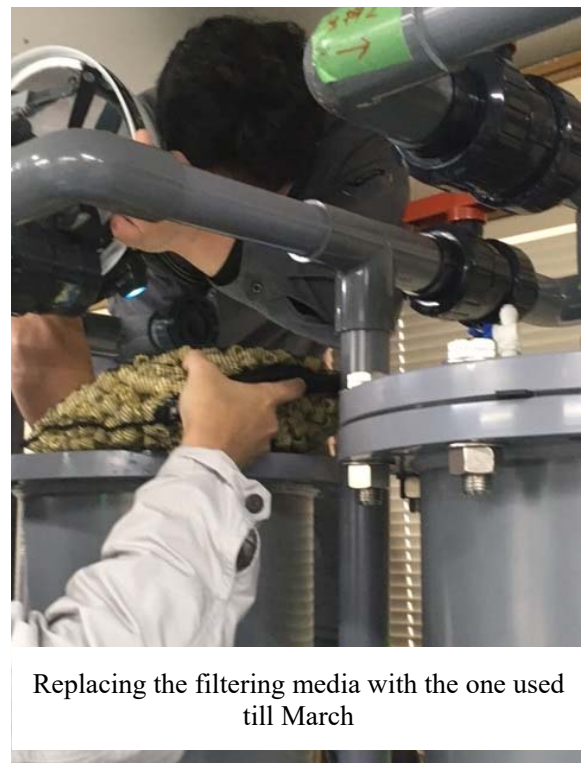

Replacing the filtering media of filter at the top of the stream

Storage conditions of the filtering media which used since March

Removal of filtering media

Replacing the filtering media with the one used till March
