<Marine Organism Rearing Log>

9 AM, August 22, 2022

Weather: Sunny

Water temperature: 18.1°C

We have partially replaced the filtering media on August 17 due to poor growth of the bacteria which decompose annmonia included in excrement. Finally, it paid off. It must have been tough environment for abalones which are vulnerable to ammonia, yet, they will thrive, we assume. Now, we will keep our eyes on nitrous acid and nitric acid derived from ammonia.

Water Quality Inspection on August 19, 2022, ammonium-nitrogen is slightly below 10ppm
