

<Marine Organism Rearing Log>

9 AM, August 3, 2023

Weather: Sunny

Water temperature: 17.6°C

The end of last month marked 300 days since we started rearing flounder in seawater containing approximately 1,300 becquerels of tritium per liter. We have seen no difference in the growth rate, survival rate, or feeding rate (vigor) of the flounder compared to those kept in seawater to which no ALPS treated water has been added.
