

<Marine Life Rearing Log>

9 AM, August 30, 2023

Weather: Sunny

Water temperature: 18.1°C

When living organisms absorb tritium, the amount absorbed is proportionate to the amount of tritium in the habitat. Tritium is not selectively adsorbed. This is true for both the free-water and organically-bound forms of tritium, and is also true when looking at the feed ingested by flounder.

**We tried to take a photo of the instant when a flounder eats the feed but it was too quick. We also tried to take a video of an abalone eating the feed sprinkled into a transparent case. When possible, we will take photos of both the flounder and abalone eating and post them in this log.**
