9 AM, September 12, 2023

Weather: Sunny

Water temperature: 18.7°C

Flounder from a video taken on September 7th. As with most farmed flounder, a portion of the underside (the side without eyes) is colored. This coloration disappears as the flounder repeatedly dives into the sand from an early age. It has also been discovered that the entire underside of the fish will turn white when transparent glass powder is used in lieu of sand and light is shone on it from below.
