* The radioactivity density is the sum of the volatile nuclides density and the particulate nuclides density.
$\mathrm{O} . \mathrm{OE}^{-\mathrm{O}}$ is the same as $0.0 \times 10^{-0}$
Data of other nuclides is under examination.
* In the case of more than 2 nuclides, the sum of scaling factors to density limits is compared to 1 .
* "ND" indicates that the measurement result is below the detection limit.

The detection limits are as follows. Volatile: I-131: Approx. $4 \mathrm{E}-6 \mathrm{~Bq} / \mathrm{cm}^{3}$, Cs-134: Approx.8E-6Bq/cm ${ }^{3}$, Cs-137: Approx. 1E-5Bq/cm ${ }^{3}$ Particulate: I-131: Approx. $2 \mathrm{E}-6 \mathrm{~Bq} / \mathrm{cm}^{3}$, $\mathrm{Cs}-134$ : Approx. $5 \mathrm{E}-6 \mathrm{~Bq} / \mathrm{cm}^{3}$, $\mathrm{Cs}-137$ : Approx. $7 \mathrm{E}-6 \mathrm{~Bq} / \mathrm{cm}^{3} \quad$ As the detection limit may vary depending on the detectors and sample properties, there are cases where nuclides below the detection limit are detected.
